

## Product information - Protective covers

Covers offer perfect protection against all kinds of pollution, such as precipitation from trees or the pollutants in the air. The special fabric used in **Fischer Möbel covers** is ideal for weather protection applications. This 195 g/m<sup>2</sup> lightweight fabric is a 100% polyester fabric coated on one side with acrylate and impregnated with a Teflon-based finish. The special coating gives the fabric a distinct textile character. The covers are processed with special sewing threads. Due to the optimal sewing thread tension and its distribution in the seam, no water can be transported through the stitch holes. Compared to dyed materials made of polyester fabric or cotton, this special outdoor fabric from **Fischer Möbel Covers** has outstanding properties:

- Dirt-repellent
- low basis weight
- Good UV resistance in the test 6 out of 8
- High tear strength and tear propagation resistance
- High water pressure resistance
- fungicidal equipment
- Very easy to clean
- very durable
- Proven for over 20 years

### Care of protective covers

The protective covers are waterproof according to DIN 53886 but standing water should be avoided. This is especially true for protective table covers. Here it should be ensured that the water can run off the table surface (for example, by placing a wooden slat underneath or slanting the table).

Cleaning can be done manually using a soft sponge with lukewarm water (approx. 30 degrees C°) and commercially available mild detergents. If you want to store your protective covers folded, it is essential that they are dry before they can be folded. Otherwise, microbial infestation and consequent loss of strength and mildew stains may occur on the affected material.
